SECTION 8

WATER DEMANDS

8.1 Historical Water Use

Caldwell County currently has 14 water user groups (WUG) that supply water for various types of uses. There are twelve (12) entities that hold CCN and are listed as Municipal, Specialty Utility Districts, and Water Supply Corporations. The two (2) remaining user groups are state agencies. Several of the WUG supply water to other counties in addition to Caldwell.

Caldwell County water use has been primarily for municipal purposes. It appeared that prior to 1980 municipal water use accounted for about half of the water consumed, with livestock and irrigation representing the remainder. Historical water use data made available through the TWDB website is shown in *Table 8-1* and illustrated in *Graph 8-1*. The water consumption for the county, at an average of 4,800 ac-ft, has historically been used to meet municipal demands, and the remainder to meet demands for mining, manufacturing, livestock, and irrigation.

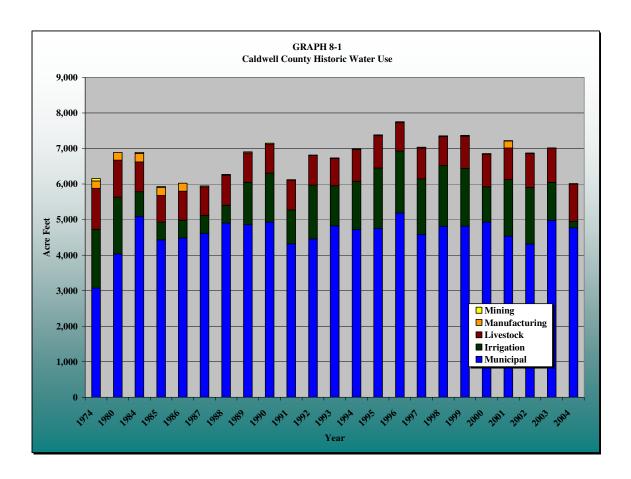

Water utilization for livestock has remained, for the most part, within the range of 800-950 ac-ft annually with an average of 850 ac-ft. Water consumption averaged about 220 ac-ft per year for manufacturing before 1986, after which there is none recorded for a few years. In 1993, manufacturing water use started up again with fluctuation of use typically less than 20 ac-ft. Irrigation use varies and ranges with minimum use of 182 ac-ft to a maximum of 1742 ac-ft annually. Mining water use has historically been limited to less than 70 ac-ft with a gradual decline in use. There is no record of water consumption for steam electric.

TABLE 8-1
Caldwell County - TWDB Historical Water Use Summary

Unit: Acre Feet (ac-ft)

| Year | Municipal | Manufacturing | Steam Electric | Irrigation | Mining | Livestock | Total |
|------|-----------|---------------|-------------------|------------|--------|-----------|-------|
| 1974 | 3,069 | 206 | 0 | 1,660 | 70 | 1,149 | 6,154 |

8.2 TWDB Water Use Projections

Klotz Associates Project No. 0972.000.000

January 2010

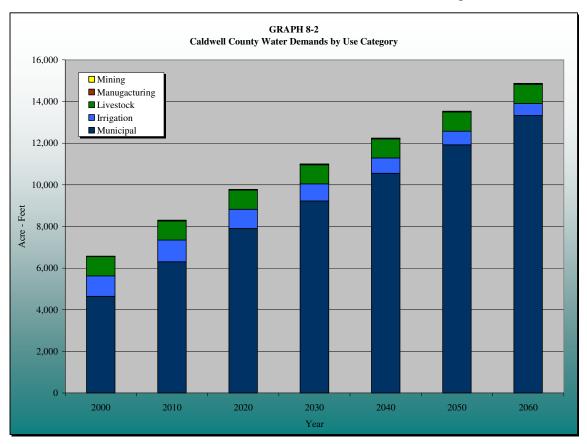

The future water demands in *Table 8-2* and *Graph 8-2* were developed by the TWDB for Caldwell County. The demands have been estimated up to 2060. The years beyond 2040 have been shaded in the table since this study is not considering the same planning horizon.

The municipal water demand projections show a consistent linear increase from 6,306 ac-ft in 2010 to 10,555 ac-ft in 2040. According to the TWDB, the municipal water demand is based on population and expected water consumption for each person with a reduction to account for conservation. The GPCD varied in the county for each water user group.

Municipal water demand projections in the 2006 Region L Plan for Caldwell County were based on 122.5 gallons per capita per day (gpcpd) for year 2010 and 113.2 gpcpd for the year 2040. These demands are lower than the demands estimated for the whole of the South Central Region in the 2006 Region L Plan of 143 gpcpd in the year 2010 and 135 gpcpd in the year 2040.

The Caldwell County Study reported on herein used 150 gpcpd for the planning horizon of 2010 to 2040. These values were adopted based on surveys completed for water supply entities in Caldwell County. Water conservation practices could reduce the per capita demand by 10 to 20 percent. The larger per capita use rates in the Caldwell County study increase the volume of future water that must be developed to meet future needs when compared to the 2006 Region L Plan.

Water demands for mining are also expected to gradually increase about 1 ac-ft a decade from 14 ac-ft in 2010 to 17 ac-ft in 2040. Manufacturing increases about 3

ac-ft a decade from 15 ac-ft in 2010 to 24 ac-ft in 2040. The livestock water demands are projected to remain constant at 918 ac-ft. The constant demand implies no increase to the number or type of livestock in Caldwell County. A steady decrease is projected in irrigation from 1044 ac-ft in 2010 to 733 ac-ft in 2040. The decrease could signify a decrease in the acreage of crop land or crop type that requires less water application. The steam electric consumption is expected to remain zero as historical use has indicated.

Source: Texas Water Development Board 2006 Regional Water Plan

In addition to projecting water demands by use, the TWDB also determined county municipal water demands for each WUG in Caldwell County. The demands are shown in *Table 8-3*. According to the TWDB, the municipal water demands increase steadily with an amount no greater than 1,500 ac-ft for every decade after 2020. The demands are based on projections of their population estimates that were discussed in Section 6 of this report.

The water user groups presented by the TWDB were developed using the population projections for the WUG in Caldwell County. The population projection estimates up to the year 2060 have been included in *Table 8-4*. The water demand and population projections according to the TWDB were last updated September 17, 2004. The tables indicate a split in region or county when

Final Report

¹⁾ Projections for years 2000 - 2060 in ac-ft¹. An ac-ft is an amount of water to cover one acre with one foot of water and equals 325,851 gallons.

applicable. A "P" in the Region Split indicates that the WUG is located in more than one region. The values determined represent only the WUG population's projections within that particular region. A "P" in the County Split column indicates the WUG is located in more than one county. The projections listed will be representative of the WUG's population projections within Caldwell County only.

8.3 Development of Water Demands

Municipal water demands for this study were based on information obtained from the TWDB, input from the Study Advisory Group and the State Demographer.

The TWDB population projections for each WUG in *Table 8-4* were further analyzed to determine percentages of the total population. The percentages calculated for each WUG, as shown in *Table 8-5*, indicated that Luling, Lockhart, and Polonia were the greatest water users in the county and accounted for over 50% of the population. The TWDB percentages of the WUG were multiplied by

¹⁾ If "P" is present in this column, the Water User Group (WUG) is located in more than one Region and the projections listed in the row represent only the WUG's population projections within that particular Region, not the WUG's total population projections. If the "P" is present for a county total entry, then the county has been split by Regional boundaries and the projections listed in the row represent only the county's populations within the particular Region, not the county's total population projections

²⁾ If "P" is present in this column, the Water User Group (WUG) is located in more than one county and the projections listed in the row represent only the WUG's population projections within that particular county, not the WUG's total population projections.

the modified TSDC Scenario 1.0, shown in *Table 8-6*, to compare the growth estimates. The modification, as mentioned in Section 6, was to adjust the population projection in 2040 to 100,000. The product of *Table 8-5* and *Table 8-6* is given in *Table 8-7*.

Table 8-7 presents the water user group population projections used in this study based on the modified TSDC Population Scenario 1.0.

In addition to calculating population projections for each WUG based on the TSDC Scenario 1.0, a per capita value was also determined to develop the water demands for this study. The per capita value has units of gallons per capita per day (gpcd). The value represents the average rate of water demand used per person per day for a given population within a distribution system.

| Total | 46,308 | 65,057 | 86,902 | 100,000 | | |

The water use and population data obtained from the surveys were factors in determining the per capita values for each utility. The per capita values determined from the surveys varied from about 84 gpcd in any one year to 160 gpcd. As shown in *Graph 8-3* the average water consumption per person has gradually increased since 2005. In 2005, the average for the utilities surveyed was 113 gpcd and increased in 2006 to 116 gpcd. There was a slight decrease in 2007 with an increase again 2008 to an average of 135 gpcd.

The compiled data was presented to the Technical Advisory Committee for a consensus on the daily per capita value to be used for the study. The Technical Advisory Committee, after discussion, agreed to proceed with a value of 150 gpcd to determine water demand projections for the county. The 150 gpcd rate was applied to the projected population figures to estimate average daily water demands. The estimated demands are shown in MGD and ac-ft respectively in *Table 8-8* and *Table 8-9*.

| Total | 7,781 | 10,932 | 14,602 | 16,803 | | | | |

The municipal water demands based on population in Caldwell County are expected to increase from 7,781 ac-ft in 2010 to 16,803 ac-ft in 2040. These municipal water demands will need to be met through surface and groundwater resources. The demands can also be reduced through various conservation measures.

8.4 Conservation Measures

Conservation measures will be required from all WUG to reduce the expected water demands. A conservation measure of 10%, illustrated in *Graph 8-4*, will decrease expected water demands and is a recommended goal for all WUGs. Many water saving strategies to achieve this goal have been added in **Appendix H.** Several of the WUG have indicated that they are already implementing some conservation measures to reduce demands and will continue to develop new strategies. The strategies developed by the WUG are also discussed in the appendix.
